

Our Recovery as a Service (RaaS)

Key benefits

- Simple to use with minimal training requirements
- Robust and scalable recovery into an enterprise-grade cloud environment
- Fast RaaS protection deployment, with no application modification required
- Full workload security in a Virtual Data Center (vDC), within your selected Recovery Time Objective (RTO)
- Full visibility and control over self-test, replication activity and service status
- Non-disruptive testing
- No hidden costs - predict and manage monthly expenses with accuracy
- Professional guidance in how to use RaaS to implement your DR or BCP strategy

Our Recovery as a Service (RaaS)

Our Recovery as a Service (RaaS)

RaaS gives you the ability to optimise the balance between disaster recovery and risk mitigation in an affordable package.

The most important objective of your business continuity plan is to ensure that business-critical data and processes are protected and downtime is minimised.

RaaS provides everything needed to effectively replicate your workloads to the cloud or within the cloud. It facilitates organisations with a means to recovering key IT resources more effectively and efficiently in an emergency.

RaaS is available to clients who wish to protect their key workloads through replication and failover with low Recovery Time Objectives and Recovery Point Objectives (RTO/RPO). Clients may protect workloads on their in-house virtualised workload environments by replicating into Sure's cloud environment, or may protect existing workloads in one of our cloud environments by replicating to a different Sure cloud environment.

About RaaS

RaaS is used for the purpose of protecting application data from service disruption by enabling full recovery where cloud computing is used. RTO and RPO can be set according to the criticality of business applications.

Due to the increasing reliance on technology, service interruptions are becoming more costly than ever before. When a disaster occurs, whether due to hardware failure, application corruption or nature, our RaaS solution will enable your business to successfully failover your protected critical workloads and, in doing so, protect data and loss of revenue whilst maintaining the reputation of your company.

* Fair usage policy applies of 20GB per day, speeds will be reduced after this limit has been reached.

To-Cloud RaaS

Businesses running VMware virtualised environments can quickly become discouraged by the myriad of complicated and expensive disaster recovery solutions available.

We want to ensure you have confidence in our service offering, which is why we provide a To-Cloud RaaS offering that is designed for ease of management, testing and verification. Our RaaS offering uses only the most advanced replication technologies, with no requirement on your part for self-assembly or maintenance of its highly developed software infrastructure.

It provides you with everything you need to successfully replicate your production workloads to a Virtual Data Centre (VDC) in our cloud, with the assurance that infrastructure capacity is able to failover and run your protected critical workloads.

In-Cloud RaaS

Should your business require geographically separated recovery environments for your critical applications and data, we can provide everything you need to effectively replicate your production workloads in one of our cloud environments to a second Sure cloud environment in another location.

In the event of a large-scale system failure, application corruption or natural disaster, our complete set of integrated technologies and services will be able to implement effective disaster recovery that can be easily tested and verified.

Our RaaS will ensure that an infrastructure capacity is in place to fully recover the loss of critical data within client specified RTO and RPO timeframes, which can be configured to near real time.
